- $\bullet$  In recent times there have been some anomalies in B decays that indicate lepton non-universal new physics.
- **•** These are in semileptonic  $b \to c\tau\bar{\nu_{\tau}}$  transitions:  $R_{D(*)}$  puzzle.
- These are in semileptonic  $b \to s\ell^+\ell^-(l = \mu, e)$  transitions:  $R_K$ ,  $R_{K(*)}$ puzzles. BR of  $b \to s\mu^+\mu^-$  modes are lower and also deviation in $P_5'$ angular observable.
- **These all indicate LUV New Physics.**

 $QQQ$ 

- <span id="page-2-0"></span>If NP is present how to probe this NP in distributions and related decays.
- LUV can often lead to lepton flavor violation.
- Will consider simultaneous explanation of  $R_{D(*)}$  and  $R_K$  puzzles ( 1412.7164, 1609.09078) and LFV tests .

 $QQ$ 

## <span id="page-3-0"></span> $R_{D^{(*)}}$  puzzle

$$
A_{SM} = \frac{G_F}{\sqrt{2}} V_{cb} \left[ \langle D^{(*)}(p') | \bar{c} \gamma^{\mu} (1 - \gamma_5) b | \bar{B}(p) \rangle \right] \bar{\tau} \gamma_{\mu} (1 - \gamma_5) \nu_{\tau}
$$
  

$$
R(D) = \frac{\mathcal{B}(\bar{B} \rightarrow D^+ \tau^- \bar{\nu}_{\tau})}{\mathcal{B}(\bar{B} \rightarrow D^+ \ell^- \bar{\nu}_{\ell})} \qquad R(D^*) \equiv \frac{\mathcal{B}(\bar{B} \rightarrow D^{*+} \tau^- \bar{\nu}_{\tau})}{\mathcal{B}(\bar{B} \rightarrow D^{*+} \ell^- \bar{\nu}_{\ell})}.
$$

# $B \to D^{(*)} \tau \nu_{\tau}$  in SM

The helicity amplitudes and consequently the NP couplings can be extracted from an angular distribution and compared with models.

Distributions have been measured very well by Belle for  $B \to D^{(*)} \ell \nu_\ell$ . We can then extract the Form Factors assuming no NP in these modes. If we observe  $\tau$  decay then we can measure  $\tau$  polarization and CPV.

 $\Omega$ 

## $B \to D^{(*)} \tau \nu_\tau$  in SM  $+$  NP, Helicity Amplitudes

Decay Distribution described by Helicity Amplitudes

$$
\mathcal{H}_{0} = \frac{4 G_{F} V_{cb}}{\sqrt{2}} \frac{1}{2 m_{D^{*}} \sqrt{q^{2}}} \Big[ (m_{B}^{2} - m_{D^{*}}^{2} - q^{2}) (m_{B} + m_{D^{*}}) A_{1}(q^{2})
$$
\n
$$
- \frac{4 m_{B}^{2} |p_{D^{*}}|^{2}}{m_{B} + m_{D^{*}}} A_{2}(q^{2}) \Big] (1 + V_{L} - V_{R}),
$$
\n
$$
\mathcal{H}_{\parallel} = \frac{4 G_{F} V_{cb}}{\sqrt{2}} \sqrt{2} (m_{B} + m_{D^{*}}) A_{1}(q^{2}) (1 + V_{L} - V_{R}),
$$
\n
$$
\mathcal{H}_{\perp} = - \frac{4 G_{F} V_{cb}}{\sqrt{2}} \sqrt{2} \frac{2 m_{B} V(q^{2})}{(m_{B} + m_{D^{*}})} |p_{D^{*}}| (1 + V_{L} + V_{R}),
$$
\n
$$
\mathcal{H}_{t} = \frac{4 G_{F} V_{cb}}{\sqrt{2}} \frac{2 m_{B} |p_{D^{*}}| A_{0}(q^{2})}{\sqrt{q^{2}}} (1 + V_{L} - V_{R}),
$$
\n
$$
\mathcal{H}_{P} = - \frac{4 G_{F} V_{cb}}{\sqrt{2}} \frac{2 m_{B} |p_{D^{*}}| A_{0}(q^{2})}{(m_{b}(\mu) + m_{c}(\mu))} (S_{R} - S_{L}).
$$

#### **Distributions**

- $F_L$  (  $D^*$ ) polarization. Distribution in  $\theta^*$ .
- $A_{FB}$  for both D and  $D^*$ . Distribution in  $\theta_I$ .
- If we make the  $\tau$  decay then we can measure the longitudinal tau polarization  $P_{\tau}(D^{(*)})$ .
- Finally we can look at CP violating terms in the angular distribution.

 $\Omega$ 

医阿里氏阿里

### CPV Triple products

- There are triple products that appear in the angular distributions proportional to sin  $\chi$  (Datta and Duraisamy.)
- The triple product in the B rest frame:  $\sim (\vec{n}_D \times \vec{n}_L) \cdot \vec{p}_{D^*} \sim \sin \chi$  with  $\vec{n}_D \sim \vec{p}_D \times \vec{p}_{\pi}$  and  $\vec{n}_I \sim \vec{p}_I \times \vec{p}_{\nu}$ .
- These T.P. are proportional to  $\mathcal{I}(H_i H^*_{\perp})$ . There are CPV. In the SM these terms are absent because all SM amplitudes have the same weak phase -  $V_{ch}$ .
- Since the  $p_{\tau}$  momentum is not known we make the  $\tau$  decay:  $\tau \to V \nu_{\tau}$ and use the V momentum to construct the T.P. ( Hagiwara, Nojiri, Sakaki).

 $\Omega$ 

イロト イ押ト イヨト イヨト

### Other Decays

NP can be constrained from other decays have the same quark transition as  $R_{D(*)}$ 

- $B_c → τ<sup>-</sup>ν<sub>τ</sub>$  (Alonso, Grinstein, Camalich).  $Γ[B_c] > Γ[B_c → τ<sup>-</sup>ν<sub>τ</sub>]$ .  $g_P$  coupling is very constrained.
- $\bullet$   $B_c \rightarrow J/\psi \tau^- \bar{\nu}_{\tau}$  LHCb measurement finds about a 2 $\sigma$  deviation from the SM.
- $b \rightarrow \tau \nu X$ (LEP) (Saeed Kamali, AD).
- Measurements in  $\Lambda_b \to \Lambda_c \tau \bar{\nu}_\tau$  can further constrain the NP parameter space. (Datta:2017aue, Shivashankara:2015cta).
- $\bullet \Lambda_b \to \Lambda_c$  form factors are calculated from lattice QCD (Datta:2017aue, Detmold:2015aaa)

Measurements from Belle finds difference in same  $q^2$  bin as LHCb

$$
Q_5 = P_5'(\mu\mu) - P_5'(ee)
$$

( 1612.05014). Large errors.

Low  $q^2$  dominated by photon pole which is not LUV. Hence measurement difficult to understand with heavy NP.

## Deviations in  $b \to s \mu^+ \mu^-$  Part I- Hadronic Uncertainty

- Anomalies appear in  $B \to K^{(*)} \mu^+ \mu^-$  (LHCb, Belle, Atlas, CMS) : Deviations branching ratios and in the angular observable like  $P'_5$ .
- BR are lower than the SM predictions.
- (LHCb)  $B_s^0 \rightarrow \phi \mu^+ \mu^-$ which are lower than SM predictions based on lattice QCD and QCD sum rules.
- Note all these are in  $b \to s \mu^+ \mu^-$  and the SM predictions are not free of hadronic uncertainties.

Fits by many authors( 1704.05435, 1704.05438, 1704.05444, 1705.05446, 1704.05447....) to all  $b \rightarrow s \ell \ell$  observables: arXiv:1704.07397 : Alok et.al.

Here NP effects only the muons.

Remember in the  $R_{D(*)}$  puzzle also indicated LH NP interactions. This gives a hint to connect the two anomalies.

 $QQ$ 

## LFV from LUV

• Glashow, Guadagnoli and Lane (GGL), 1411.0565 pointed out in general

 $LUV \Rightarrow LEV$ .

$$
\frac{G}{\Lambda_{NP}^2}(\bar b'_L\gamma_\mu b'_L)(\bar\tau'_L\gamma^\mu\tau'_L)\ ,
$$

where  $G = O(1)$ ,  $G/\Lambda_{NP}^2 \ll G_F$ 

- When one transforms to the mass basis, this generates the operator  $(\bar{b}_L \gamma_\mu s_L)(\bar{\mu}_L \gamma^\mu \mu_L)$  that contributes to  $\bar{b} \to \bar{s} \mu^+ \mu^-$ . The contribution to  $\bar{b}\to \bar{s} e^+e^-$  is much smaller, leading to a violation of lepton flavor universality.
- GGL's point was that LFV decays, such as  $B\to K\mu e$ ,  $K\mu\tau$  and  $B_s^0\to$  $\mu$ e,  $\mu\tau$ , are also generated.

 $QQQ$ 

## $R_K$  and  $R_{D(*)}$

Assuming the scale of NP is much larger than the weak scale, the semileptonic operators should be made invariant under the full  $SU(3)_C \times SU(2)_L \times U(1)_Y$  gauge group. (Bhattacharya, Datta, London, Shivshankara, 1412.7164) considered two possibilities for LH interactions:

$$
\begin{array}{rcl}\n\mathcal{O}^{NP}_1 & = & \frac{G_1}{\Lambda_{NP}^2} (\bar{Q}'_L \gamma_\mu Q'_L)(\bar{L}'_L \gamma^\mu L'_L) \;, \\
\mathcal{O}^{NP}_2 & = & \frac{G_2}{\Lambda_{NP}^2} (\bar{Q}'_L \gamma_\mu \sigma^I Q'_L)(\bar{L}'_L \gamma^\mu \sigma^I L'_L) \\
& = & \frac{G_2}{\Lambda_{NP}^2} \left[ 2(\bar{Q}'_L^i \gamma_\mu Q_L^{ij})(\bar{L}'_L \gamma^\mu L'_L) - (\bar{Q}'_L \gamma_\mu Q_L^j)(\bar{L}'_L \gamma^\mu L'_L) \right] \;. \n\end{array}
$$

Here  $Q' \equiv (t', b')^T$  and  $L' \equiv (\nu'_\tau, \tau')^T$ . The key point is that  $\mathcal{O}_2^{NP}$ contains both neutral-current (NC) and charged-current (CC) interactions. The NC and CC pieces can be used to respectively explain the  $R_K$  and  $R_{D(*)}$  puzzles.  $QQQ$ 

### UV completion

- UV completions considered by many authors e.g. L. Calibbi, A. Crivellin and T. Ota, 1506.02661 considered possible UV completions that can give rise to  $\mathcal{O}_{1,2}^{\mathit{NP}}$ .
- (i) a vector boson (VB) that transforms as  $(1, 3, 0)$  under  $SU(3)_C \times$  $SU(2)_L \times U(1)_Y$ , as in the SM.
- $\bullet$  (ii) an  $SU(2)_L$ -triplet scalar leptoquark  $(S_3)$   $[(3, 3, -2/3)]$ .
- $\bullet$  (iii) an  $SU(2)_L$ -singlet vector leptoquark  $(U_1)$   $[(3, 1, 4/3)]$ .
- $SU(2)_I$ -triplet vector leptoquark  $(U_3)$   $[(3, 3, 4/3)]$ .
- The vector boson generates only  $\mathcal{O}_2^{NP}$ , but the leptoquarks generate particular combinations of  $\mathcal{O}_1^{NP}$  and  $\mathcal{O}_2^{NP}$ .  $QQQ$

#### Models

- Note to simply explain  $b \to s\ell^+\ell^-$  we can have  $Z'$   $(1, 1, 0)$  from  $U(1)$ . One can consider both  $(1, 3, 0)$  and  $(1, 1, 0)$ .
- Models with  $U(2)_q \times U_1(2)$  flavor symmetry and breaking: See for example: Dario Buttazzo, Admir Greljo, Gino Isidori David Marzocca (Zurich U.) 1706.07808.
- Many of the general features can be understood in a simple analysis.
- In models other processes get affected and so specific models are more constrained.

 $\Omega$ 

 $\mathbf{A} \oplus \mathbf{B}$   $\mathbf{A} \oplus \mathbf{B}$   $\mathbf{A} \oplus \mathbf{B}$ 

## Models: Bhattacharya, Datta, Guevin, London, Watanabe, 1609.09078

Models: Vector Bosons and Leptoqaurks.

Transform to the mass basis:

$$
u'_L = U u_L, \quad d'_L = D d_L, \quad \ell'_L = L \ell_L, \quad \nu'_L = L \nu_L,
$$

The CKM matrix is given by  $\mathit{V_{CKM}} = \mathit{U}^\dagger \mathit{D}$ . The assumption is that the transformations  $D$  and  $L$  involve only the second and third generations:

$$
D = \begin{pmatrix} 1 & 0 & 0 \\ 0 & \cos \theta_D & \sin \theta_D \\ 0 & -\sin \theta_D & \cos \theta_D \end{pmatrix}
$$

$$
L = \begin{pmatrix} 1 & 0 & 0 \\ 0 & \cos \theta_L & \sin \theta_L \\ 0 & -\sin \theta_L & \cos \theta_L \end{pmatrix}.
$$

 $\Omega$ 

#### SM-like vector bosons

This model contains vector bosons (VBs) that transform as  $(1, 3, 0)$  under  $SU(3)_C \times SU(2)_L \times U(1)_Y$ , as in the SM. The coupling is to only third generation. In the gauge basis, the Lagrangian describing the couplings of the VBs to left-handed third-generation fermions is

$$
{\cal L}_V \;\; = \;\; g_{qV}^{33} \left( \overline{Q}'_{L3} \; \gamma^\mu \sigma^I \; Q'_{L3} \right) V^I_\mu \; + \; g_{\ell V}^{33} \left( \overline{L}'_{L3} \; \gamma^\mu \sigma^I \; L'_{L3} \right) V^I_\mu \; .
$$

$$
\mathcal{L}_V^{eff} = -\frac{g_q^{33} g_{\ell V}^{33}}{m_V^2} \left( \overline{Q}'_{L3} \gamma^{\mu} \sigma^I \ Q'_{L3} \right) \left( \overline{L}'_{L3} \gamma_{\mu} \sigma^I L'_{L3} \right) .
$$

$$
g_1 = 0 \ , \quad g_2 = - g_{qV}^{33} g_{\ell V}^{33} \ .
$$

The VB model also generates 4 quark and 4 lepton operators that contribute to  $B_s$  mixing,  $\tau \to \mu\mu\mu$  e.t.c. Variation of this model with more parameters.

 $\Omega$ 

## Models: allowed parameter space:  $R_K \sim \sin \theta_D \cos \theta_D \sin^2 \theta_L$

$$
 model:  $|h_{U_1}^{33}|^2 = 1$ 

ا Figure 29, 2018 - Alakabha Datta (UNISS) - Alakabha Duaghosing New Physics with LUV and LPV Alakabha Datta (UMiss) [Diagnosing New Physics with LUV and LFV](#page-0-0) B Decays May 29, 2018 31 / 36

This decay is particularly interesting because only the VB model contributes to it. The present experimental bound is  ${\cal B}(\tau^-\to\mu^-\mu^+\mu^-)$   $< 2.1\times 10^{-8}$  at 90% C.L. . Belle II expects to reduce this limit to  $< 10^{-10}$  . The reach of LHCb is somewhat weaker,  $< 10^{-9}.$ Now, the amplitude for  $\tau \to 3\mu$  depends only on  $\theta_L$ . The allowed value of  $\theta$ , corresponds to the present experimental bound. That is, VB predicts

$$
\mathcal{B}(\tau^- \to \mu^- \mu^+ \mu^-) \simeq 2.1 \times 10^{-8} .
$$

Thus, the VB model predicts that  $\tau \to 3\mu$  should be observed at both LHCb and Belle II. This is a smoking-gun signal for the model.

## Υ Modes( Leptoquarks)

- $\bullet$  T(3S)  $\rightarrow \mu \tau$ :
	- VB  $\mathcal{B}(\Upsilon(3S) \to \mu \tau) \simeq 3.0 \times 10^{-9}$ ,  $U_1$  :  $\mathcal{B}(\Upsilon(3S) \to \mu \tau)|_{\text{max}} = 8.0 \times 10^{-7}$ .

Belle II should be able to measure  $\mathcal{B}(\Upsilon(3S) \to \mu \tau)$  down to  $\sim 10^{-7}.$ 

**•** Even though we do not find observable effects in  $b \rightarrow s\tau\tau$  or  $b \rightarrow s\tau\mu$ others have have found larger effects( See for e.g. 1703.09226).

#### Collider Search: 1706.07808

High- $p_T$  searches are concerned, particularly stringent bounds are set by  $pp \rightarrow \tau \bar{\tau} + X$ 

$$
\Delta \mathcal{L}_{bb\tau\tau} = -\frac{1}{\Lambda_0^2} \left( \bar{b}_L \gamma_\mu b_L \right) \left( \bar{\tau}_L \gamma_\mu \tau_L \right) , \qquad \qquad \Lambda_0^2 = \frac{v^2}{G_1 + G_2} \ . \tag{10}
$$

The present bounds on the EFT scale  $\Lambda_0$  were derived recasting different ATLAS searches for  $\tau\bar{\tau}$  resonances, and read  $\Lambda_0 > 0.62 \,\mathrm{TeV}$ . Newer fits:  $\Lambda_0 \approx 1.2$  TeV, which is well within the experimental limit.

Lepton flavor violating decays:  $gg \rightarrow \tau \mu$  (1802.06082, 1802.09822) or  $gg \rightarrow \bar{t} t \tau \mu$  (1412.7164).

$$
\Delta \mathcal{L}_{tt\tau\mu} = -\frac{1}{\Lambda_0^2} \left( \bar{t}_L \gamma_\mu t_L \right) \left( \bar{\tau}_L \gamma_\mu \mu_L \right) \tag{11}
$$

### Collider Search: 1706.07808

 $Z'$   $(1,3,0)$  is strongly constrained(ruled out) unless width is large.  $Z'$ (1, 1, 0) explaining only  $R_K$  is fine:  $M_{Z'} \sim 30$  TeV.

#### <span id="page-35-0"></span>**Conclusions**

- $\bullet$  Several anomalies in B decays indicating lepton non-universal interactions.
- **•** These anomalies may arise from the same New Physics.
- Anomalies indicate LUV. In general we should also observe LFV processes.
- **Interesting modes are**  $\tau \to 3\mu$  **and**  $\Upsilon(35) \to \mu\tau$ **. Observation of these** modes can point to specific models of new physics.
- Other analysis find  $b \to s\tau\tau(B_s \to \tau^+\tau^-, B \to M\tau^+\tau^-)$  or  $b \to s\tau\tau(B_s \to \tau^+\tau^-)$  $s\tau\mu(B \to M\tau\mu, B_s \to \tau\mu)$  also promising.
